

CAT RESTRAINING CARRIER

High quality cage specially designed to facilitate injection or any other treatment in nervous or difficult to handle cats. It can also be used with other small species.

- Light
- Easy to clean
- Removable door panel options

Also known as a "trapping cage" or "compression box" by veterinary professionals, this carrier includes a restraint panel that allows the cat to be kept gently still so that an intramuscular injection (or other treatment) can be administered.

The basket consists of a standard transport cage equipped with a movable internal partition with rods to move it that extend out of the basket. In practice, the partition is moved forward until the animal is held gently but firmly against the wall of the basket. Held in this position, the handles can be pressed together with one hand, while the injection can be administered with the other.

It has a sliding door panel at one end that allows the transfer of a cat from its carrier, which eliminates the need to handle wild cats or complicated handling, thus avoiding unnecessary risks.

Dimensions: length 46cm x width 29cm x height 29cm.
Weight 2.9 kg.
